Skyline Energy – Solar Electricity

one of the best long-term investments you can make!

People install Solar Electricity (PV systems) for a number of reasons;

- To reduce their carbon footprint
- To take advantage of solar rebates
- To hedge against increasing living costs etc. etc.

Skyline Energy have crunched the numbers, and while the Premium Feed-In Tariff is still available (PFIT), for residents of Victoria, we have found that their PV systems should actually be thought of, and sized appropriately as an investment generating a yield or return, similar to any investment, but with very different risks. Depending on a number of assumptions, the return achievable can be well over 15%pa! So it is well worth considering for those who have funds available to invest. But what about those who don't? Can they achieve such returns, and is it sensible for them to install PV systems?

Whether PV systems will generate an adequate yield will depend on a number of factors, such as site suitability, current energy use, electricity Feed In Tariff, and the size of the PV system installed (among other factors). Skyline Energy are able to accurately perform an assessment of the potential for a PV system in your circumstances. We may be able to assist you with the most sensible way to fund your purchase.

Refinancing to buy solar panels may seem like lunacy but consider this:

Once your PV system has generated your electricity consumption, the extra electricity is sold to the Electricity Retailer at 60 cents per Kwh (approx. three times the rate it costs).

Using our finance broker, you may be able to actually improve your cash flow by way of reduced bills extra income, depending on the size of the system, whilst simultaneously reviewing your existing arrangements.

- No upfront costs
- Thousands of dollars saved in electricity costs
- Thousands of dollars earned from selling the excess electricity to the retailer at the higher PFIT rate (60c/kWh)
- Improved cashflow
